

Probios® Equine One Gels: Easy Sources of Beneficial Bacteria

Knapp, WI, May 8, 2008—Probios® Equine One Oral Gels are quick, easy-to-use direct fed microbial (DFM) gels providing beneficial bacteria to horses and foals undergoing diarrhea or foal heat diarrhea, worming, dietary changes, antibiotic therapy, environmental changes, colic, and traveling. With four types of naturally occurring microorganisms including *Enterococcus faecium*, *Lactobacillus acidophilus*, *Lactobacillus casei*, and *Lactobacillus plantarum*, these gels show positive effects on feed intake, weight gain, and recovery from illness.

After foaling, a mare needs to maintain her appetite and keep a good milk flow. At the same time, the foal needs to acquire beneficial bacteria in its digestive tract to avoid situations like foal heat diarrhea. These are critical times to use Probios® Equine One Oral Gels. In addition, antibiotic therapy destroys both pathogenic microorganisms and beneficial bacteria naturally found in the digestive tract. Using these gels after therapy is a way to balance microflora in the digestive tract.

Dosing is simple: adult horses get 15 grams at the onset of a stressful incident and foals get 10 grams at birth and day four. A convenient dial-a-dose syringe will give the recommended amount with the push of a plunger. Each dose contains a guaranteed 10 million Colony Forming Units (CFUs) per gram of lactic acid bacteria.

Horses also benefit from daily feeding of either Probios® Dispersible Powder or Feed Granules as part of the Probios® Equine Program. For more information about Probios® Equine One Oral Gels and the Equine Program, please call 800-468-3877.
